beta-catenin - Hydra magnipapillata
C;Species: Hydra magnipapillata
C;Saccession: JG4835
R;Hobmayer, E.; Hatta, M.; Fischer, R.; Fujisawa, T.; Holstein, T.W.; Sugiyama, T.
Gene 172, 155-159, 1996
A;Title: Identification of a Hydra homologue of the beta-catenin/plakoglobin/armadill
A;Reference number: JG4835; MUID:96257271
A;Reference number: JG4835
A;Status: nucleic acid sequence not shown
A;Residues: 1-806 < HOBS
A;Cross-treferences: GB:U36781; NID:91407600; PIDN:AAC47137.1; PID:91407601
C;Goment: This protein plays roles in cadherin-mediated cell adhesion and in signal
C;Genetics:
A;Gene: betaCtn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Deta-catenin - Caenorhabditis elegans
C.Species: T5-oct-1999 #sequence_revision 15-oct-1999 #text_change 31-Jan-2000

Agents for treating human diseases, particularly cancer, modulate interaction of beta-catenin with transcription factors or tumor

```
This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the Wint signalling pathway and is involved in development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic unit interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to treat tumors, especially carcinoma of the colon and melanoma, but also, the cate they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. AAY33217-Y33222 represent human beta-catenin armadillo repeat fragments described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compounds targeting nucleic acids encoding human beta caterin (HBC) useful for treating diseases associated with HBC expression and as prophylaxis to prevent or delay infection, inflammation or tumor formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        catenin; cadherin; metastasis; cadherin-associated protein; o; colorectal cancer; melanoma; antisense oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses a method of female primate contraception comprising administering an antagonist of a Wnt polypeptide, inhibiting occyte development. Wnt polypeptides are useful for promotive meturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of Wnt polypeptides have the ability to inhibit Wnt signalling, e.g., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human beta-catenin; Wnt antagonist; contraceptive; contraceptive vaccine; oocyte development; female primate contraception; oocyte viability; monoclonal antibody; Wnt signalling.
                                 Beta, catenin is a member of the catenin family of cytosolic proteins and a key member of the Wnt signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness. The loss of cell adhesiveness is implicated in metastrasis. Beta catenin is also known as cadherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonucleotides (AAARSIST-ASSASSG). The oligonucleotides are capable of hybridising to human beta catenin, in order, to inhibit expression of human beta catenin. The oligonucleotides may be used in gene therapy for colorectal cancer or melanoma.

Parkinson's disease, Hunchagoo's disease, and amyotrophic lateral sclerosis. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopolesis and is useful for treating myeloid or hypphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, or ligament and/or nerve disorders, or periodontal disease. Furthermore, (I) is also useful for gut, protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems.

In addition, (I) affects blorhythms or circadian cycles of rhythms,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                   fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAUZ8020-AAUZ8395 represent novel human secreted protein amino acid sequences of the invention.
the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      In: vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels of beta-catenin in the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; stem cell culturing; progenitor cell; pluripotential phenotype;

The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell in a notion of beta-catenin in a progenitor or stem cell in the outlance medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells; sexpanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute containing in a host that is deficient in a particular cell lineage or inneages. The expanded cell populations are also useful in campagenate recipients. The present sequence is human beta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway intitated by Mnt proteins, which are mediators of several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        781 AA;

of In vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels beta-catenin in the cell

Disclosure; Page 28-30; 33pp; English.

The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell

```
ö
in antin vitro; culture medium for a period sufficient for the progenitor oristem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in a factorial control of stem cells, e.g. to reconstitute transpandantation to restore haematopoietic function to autologous or allogeneic recipients. The present sequence is mouse beta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway initiated by whit proteins, which are mediators of several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Control of the lycolated human secreted polypeptides (1) and polynucleotides (II). (I) and (II) are useful for traating inflammatory conditions such as arthritis, nephritis, Crohn's disease, inflammatory conditions such as arthritis, nephritis, Crohn's disease, inclammatory conditions such as arthritis, nephritis, Crohn's disease, and so in increasing haematopolesis, stem cell survival, bone growth conditions of the central cells are readment of one or more cancers. (II) is also useful for creating transquaic animals useful for studying modulators of the polypeptides of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral experiments of sisease, and amyotrophic lateral experiments of sisease, involved in chemotactic or chemokinetic activity, regulation of haematopolesis and is useful for treatment of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcase, for treating osteoporosis, osteoarthitis, bone degenerative culcars, or periodontal disease. Furthermore, (I) is also useful for ucers, for treating osteoporosis, osteoarthitis, bone degenerative culcars, including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasathenia gravis, allergic fungal infections, autoimmune disorders e.g. multiple sclerosis, changes in addition, (I) affects blorhythms or circadian cycles of rhythms, and conditions, such as asthma or other respiratory problems. In addition, carbellism, carbohydrate, vitamins, minerals, proviecs analgesic effects or other pain reducing effects, immune response. Aucususo-Aucususys or eliminal sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Beta-catenin; human; armadillo repeat; treatment; human disease; LEF-1; modulator; interaction domain; transcription factor; TCF-4; oncogenic; tumor suppressor gene; conductin; E-cadherin; screening; carchinoma; APC; Wnt signalling pathway; tumor development; anti-oncogenic; melanoma; organ regeneration; tissue regeneration; hair growth; mutant.
                                                                                                                                     The invention relates to novel isolated human secreted polypeptides (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

which is based on substances (1) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor-suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the armadillo domain (arm units 3-8) of beta-catenin, and mutants of the specific interaction domains for LEF-1, TCF-4, APC, conductin or E-cadherin; and (c) enzyme-linked immunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the Wht signalling pathway and is involved in the vocogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to treat, tumors, especially carcinoma of the colon and melanoma, but also, where the promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. AAY3320*Y33241 represent mutant the method of thuman, beta-catenin armadillo repeat fragments described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                          This invention describes a novel agent (A) for treating human disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                               is
                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072).. The sequence data for this patent did not form part of the printed the specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at: ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insectiodes, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA-sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL6176-ABL30511).
                                                                                                                                                                                                                                                                                                    Gaps

C 3-CATABLILIZED (LOW DITHE PROTICU IN CYTOPLASM.

C 3-CATEMIN IS REDUCED AND THE PROTICU IN CYTOPLASM.

C 3-CATEMIN IS REDUCED AND THE BETA-CATEMIN FAMILY.

C 1-SIMILARITY: CONTAINS 12 ARM REPEATS.
                               the dimerization and beta-catenin-binding region of

TRANSLOCATES TO THE NUCLEUS WHEN IT IS STABILIZED (LOW LEVEL OF PHOSPHORYLATION) BY SIMILARITY).
-!- TISSUE SPECIFICITY: EXPRESSED IN THE TESTIS.
-!- DEVELOPMENTAL STAGE: HIGHLY EXPRESSED AT E30-60 DAY DPC.
-!- PTHIS FROUCED EXPRESSED IN THE TESTIS.
-!- PTM: PROBABLY PHOSPHORYLATED BY GSR-3B. WHY-DEPENDENT ACTIVATION OF DVL ANTAGONIZES THE ACTION OF GSR-3B. PHOSPHORYLATION OF BETA-CATENIN IS REDUCED AND THE PROTEIN IS NO LONGER DEGRADED,
RESULTING IN ITS ACCUMULATION IN CYTOPLASM (BY SIMILARITY).
-!- SIMILARITY: GONTAINS 12 ARM REPEATS.
                                                                             Rattus norvegicus (Rat).

-!- FUNCTION: BINDS TO THE CYTOPLASMIC DOMAIN OF THE CELL-CELL
- ADHESION MOLECULE E-CADHERIN, AND PERHAPS TO OTHER (MEMBRANE)
- PROTEINS. THE ASSOCIATION OF CATENINS TO CADHERINS PRODUCES A
COMPLEX WHICH IS LINKED TO THE ACTIN FILAMENT NETWORK, AND WHICH
SEEMS TO BE OF PRIMARY IMPORTANCE FOR CADHERINS CELL-ADHESION
PROPERTIES. ESSENTIAL COMPONENT OF THE VERTEBRATE WHT-SIGNALING
PATHWAY AND IS REQUIRED FOR FORMATION OF THE EMBRYONIC AXIS.
-!- SIMILARITY: BELONGS TO THE BETA-CATENIN FAMILY.

Proc. Natl. Acad. Sci. U.S.A. 86:4027-4031(1989).

-1-FONCTION: COMMON JUNCTIONAL PLAQUE PROTEIN. THE MEMBRANE-
ASSOCIATED PLAQUES ARE ARCHITECTUBAL ELEMENTS IN AN IMPORTANT
C. STRATEGIC POSITION TO INPLUENCE THE ARRANGEMENT AND FUNCTION
OF BOTH THE CYTOSKELETON AND THE CELLS WITHIN THE TISSUE. THE
PRESENCE OF PLAKOGLOBIN IN BOTH THE DESWOSOMES AND IN THE
INTERMEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRATEGIC PROCESSION SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRATEGIC PROCESSION SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRATEGIC PROCESSION OF SUBMEMBRANOUS PLAQUES.
                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostoml;

THE MEMBRANE-ASSOCIATED PLAQUE PROTEIN. THE MEMBRANE-ASSOCIATED PLAQUES ARE ARCHITECTURAL ELEMENTS IN AN IMPORTANT STRATEGIC POSITION TO INFLUENCE THE ARROGEMENT AND FUNCTION OF BOTH THE CYTOSKELETON AND THE CELLS WITHIN THE TISSUE. THE PRESENCE OF PLAKOGLOBIN IN BOTH THE DESMOSOMES AND IN THE INTERMEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.

suppressor gene products

```
This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the unteraction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF+4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the armadillo domain (arm units 3-8) of beta-catenin, and mutants of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of screening substance libraries for compounds that modulate interaction of the whit signalling pathway and is involved in beta-catenin to fumors. Generally its interaction with LEF-1 or TCF-4 is concogenic but interaction with APC, conductin or E-cadherin is oncogenic (A) which inhibit interaction are particularly used to treat tumors, especially caracthoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically mair growth. AAY33217-Y33222 represent human of the colon and melanoma of the colon and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  administering an antegonist of a Whit polypeptide, inhibiting occyte development. Whit polypeptides are useful for promotive maturation of an immature occyte. Whit polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Solubbe fragments of Whit polypeptides have the ability to inhibit Whit signalling, e.g., by blocking binding of a naturally-occurring Whit protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
                                             Beta catenin is a member of the catenin family of cytosolic proteins and a key member of the Mnt signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness. The loss of cell adhesiveness is implicated in metastasis. Beta catenin is also known as cadherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonucleotides (AAA58327-A58566). The oligonucleotides are capable of human beta catenin. The oligonucleotides are capable of human beta catenin. The oligonucleotides may be used in gene therapy for colorectal cancer or melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       patent discloses a method of female primate contraception comprising
